

Programming Assignment VIII

Minimum Spanning Tree

Due Date: 2022/12/13 (60)

1 Description of Assignment

Design and implement efficient data structure and algorithm for computing minimum spanning tree of a weighted graph. Kruskal's algorithm and disjoint set data structure is preferred in this assignment.

2 Input

The input file is a weighted graph $G = (V, E, w)$. For the input of the graph, refer to the sparse matrix in Programming Assignment IV.

3 Output

The output is the minimum spanning tree of the input graph. Print out the weight of the minimum spanning tree, and then print the spanning tree by listing its edges. Graph visualization libraries can also be used to display the graph and the minimum spanning tree. If there is no graph visualization library available in your programming environment, it is also acceptable to draw it manually in your report.

Notes

The format of the report of the assignment does not need to be very formal, but it should be close to the format of a research technical report.

1. Title and Author.
Include *assignment number*, *your name*, *student number* and *email address* on the *first* page of your report.
2. Statement of the problem.
A “formal” description of the problem in this assignment. In addition to the basic requirements specified in the assignment, emphasize the functions or features you implemented.
3. Main results.
This section should include at least the following items.

- (a) Description of the design of your program.
 - (b) Describe the data structures used in the program to improve the efficiency of the program. These data structures should be implemented by you and appear in the first part of the program.
 - (c) List of your program with comments. If your program is very long, list only the main parts of the program here and the entire program in an appendix. Additional comments can be added manually to explain the design of the program.
 - (d) Outputs of the compilation and the executions of your program.
4. Conclusions
- Give a brief summary of what you did, and interesting thing you learned from this assignment.

Additional notes:

1. Turn in your report on or before due day.
2. The output of the program execution should indicate the correctness of your program. In other words, a set of comprehensive (but not necessarily exhaustive) annotated test data for the problem should be provided to show that your program is indeed correct. This can be done by carefully selecting a set of test data.
3. Print or write the report on A4 papers. Bind them together in the upper left corner.
